axialHealthcare identifies and mitigates patient risk due to opioid use. Using integrated technology and targeted clinician engagement, axialHealthcare partners with our nation’s forward-thinking payers to arm provider networks with actionable insights to better assess, diagnose, and treat patients for improved outcomes.

axialHealthcare’s approach to driving safe opioid prescribing and evidence-based treatment for opioid use disorder incorporates several of the Action Collaborative’s priority focus areas. More specifically, we offer data-driven and tech-enabled capabilities to providers and the extended care team that alert to high-risk patients and clinical events, such as the need to evaluate for opioid use disorder, while also providing interactive clinical decision support to help manage patients’ opioid use in an evidence-based manner. In cases of escalating risk, our clinical team offers direct clinical decision support to providers via telephone and in-person visits.

We’re committed to expanding the use of evidence-based guidelines for opioid therapy. Not only are our solutions based in and continually updated with the latest evidence on pain and opioid care, but we also add to the literature through our own peer-reviewed studies on opioid therapy and raise awareness of quality prescribing and care for patients through partnerships with national quality organizations.

axialHealthcare will continue to build solutions and services to tackle the evolving challenges we are facing with the opioid epidemic- strategically aligning with the health plan to build strong provider networks and optimize patient outcomes. We are proud to stand with other organizations committed to addressing the opioid epidemic and its widespread impact.
